“The combination of standard solutions and the inherent flexibility of Jeeves’ ERP system concept give us a total solution for our industry-specific needs. In addition, with Jeeves as our common ERP system we create significantly improved possibilities for collaboration between our subsidiaries in Europe. This is in line with our ambitions to form stronger bonds between our geographically spread operations, thus gaining better control and use of resources,” says Lars Wiking, CIO of Thomas Concrete Group.

“The information in Jeeves databases is what we in management use as our guide. We can quickly generate reports and identify opportunities and bottlenecks. Right now, the focus is on streamlining our administration, improving control of our customers’ profitability and production. Our tools for decision support provide executive management with information from Jeeves. Naturally, we also see opportunities for increased business benefit there,” says Lars Wiking. “Our administrative costs per cubic meter of concrete were greatly reduced while net sales have increased by more than 150% in recent years. Availability in the solution has been technically ensured by running Jeeves in a clustered, redundant server environment.”
